

Germany — the continuous arc to the renewable vertex

Twenty-five years of deliberate composition change. The size view shift is real — the yeast moments show when it actually accelerated.

B. Helmsman trajectory · flips: 13

Carrier key (used in panels A and C):

D. Top yeast moments — Germany

	transition	carrier	AC×size	PowShr	Size@
1.	2005-2006	Solar	333×	71.1%	0.214%
2.	2008-2009	Solar	105×	75.1%	0.713%
3.	2006-2007	Solar	75×	27.2%	0.360%
4.	2023-2024	Nuclear	62×	88.9%	1.425%
5.	2009-2010	Solar	49×	55.5%	1.143%
6.	2002-2003	Bioenergy	37×	33.4%	0.910%

Germany's transition is the textbook case of a continuous arc: coal recedes, gas holds, solar and wind grow steadily.

But the Power Share view shows the acceleration moments — solar in 2005-2006 at 0.21 % composition share doing 71 % of the structural directional work (activation coefficient $\approx 333\times$).

That is the structural beginning of the Energiewende — three years before the size view would call it visible.
