

United Kingdom — the coal exit as a regime change

A policy-driven structural transition. Coal goes from dominant to near-zero across the period.

Carrier key (used in panels A and C):

D. Top yeast moments — United Kingdom

	transition	carrier	AC×size	PowShr	Size@
1.	2001-2002	Wind	190×	47.5%	0.249%
2.	2024-2025	Coal	129×	86.3%	0.669%
3.	2013-2014	Solar	107×	60.2%	0.561%
4.	2003-2004	Wind	102×	32.9%	0.324%
5.	2005-2006	Wind	92×	66.9%	0.728%
6.	2012-2013	Solar	91×	33.7%	0.371%

The UK story is the abrupt-policy archetype. Coal's share drops from over 30 % to under 2 % across the period.

The Power Share view names what made it possible: Other Renewables and Wind in the late-2010s took turns doing the structural work of absorbing coal's exit, often at low single-digit composition share (panel D).

Without the activation coefficient, those small-share carriers are invisible. With it, the whole transition snaps into focus.
