

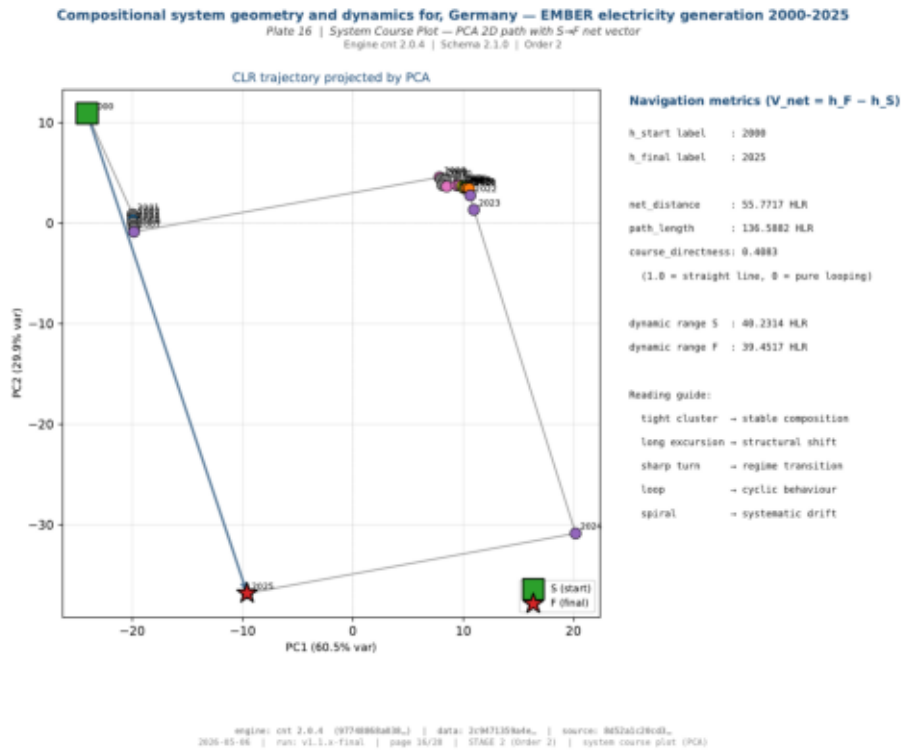

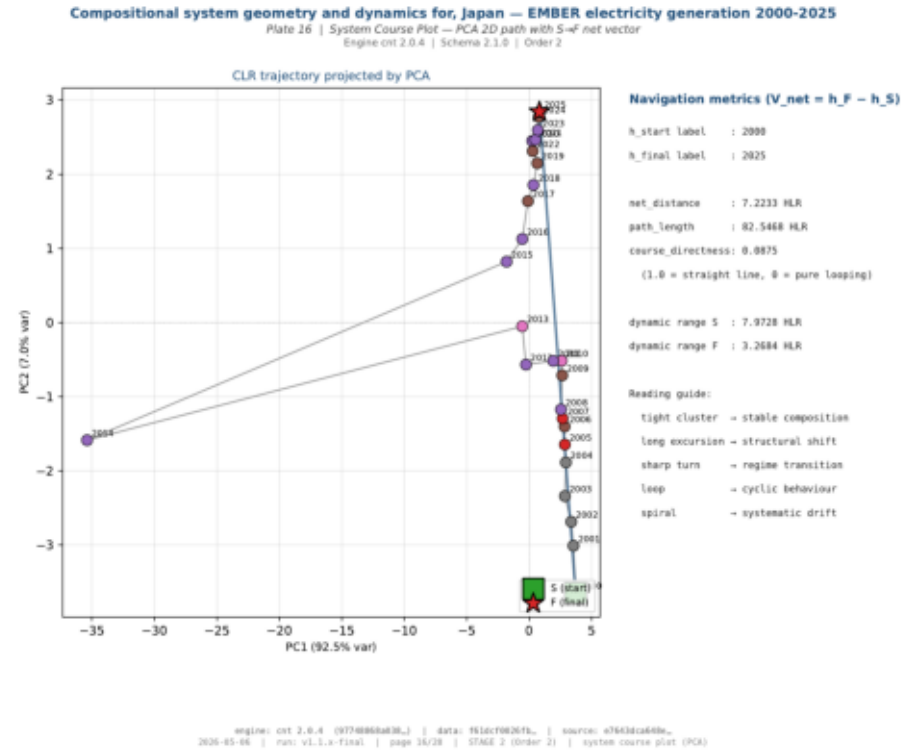

Fig. 6 | System Course Plots — CLR trajectory of each country's energy mix, 2000–2025

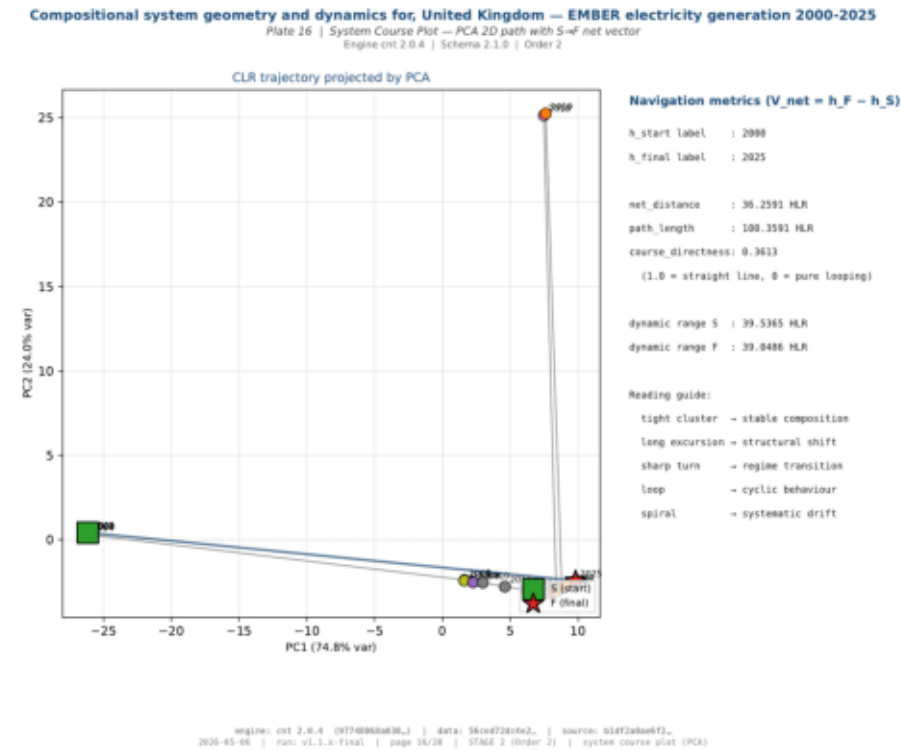

A. Germany · Continuous arc — coal recedes, renewables grow steadily.

B. Japan · External shock with multi-year reorganisation — Fukushima 2011.

C. United Kingdom · Policy-driven regime change — coal-exit step in 2019-2020.

Each labelled point is one annual composition; the path between successive points is the structural drift on the simplex. Navigation metrics readout on the right of each panel: net_distance (start→final Aitchison-norm displacement), path_length (total integrated step length), course_directness (net/path; 1.0 = straight line, 0 = pure looping).
